You have a **CHOICE**

eXRP Cruise

eXRP Cruise is a high-end laminate, where the main parts of the material are made from recycled polyester; that is the UV protective film, the taffeta, and the polyester fibers. An eco-friendly choice, at the same price level as comparable laminates! Now is a good time to embark on our journey!

eXRP

The combination of black polyester fibers and white taffeta makes up for a greyish look. The eXRP cruise comes in three qualities which are all further stabilized using up to 5% of UPE virgin fibres. The material is used for trioptimal layouts and has proven to be very form stable. The material is soft and easy to handle, and furls easily when used in furling sails.
